Error in G + C calculations

William B. Whitman

Department of Microbiology, University of Georgia, Athens, GA 30602-2605, USA

Due to a calculation error, incorrect values of the DNA mol% G + C content were reported for type and other strains of some recently described species. The correct mol% G + C values ($\pm$ SD, n = number of observations) are:

Desulfonatronum thiodismutans MLF1^T, 59.0 ± 0.1 mol% (n = 6; Pikuta *et al.*, 2003b);

Roseovarius nubinhibens ISM^T, 62.2 ± 0.2 mol% (n = 4; González *et al.*, 2003);

Silicibacter pomeroyi DSS-3^T, 64.1 ± 0.1 mol% (n = 3; González *et al.*, 2003), and *Silicibacter pomeroyi* DSS-10, 64.3 ± 0.1 mol% (n = 6; González *et al.*, 2003);

Spirochaeta americana ASpG1^T, 54.2 ± 0.2 mol% (n = 4; Hoover *et al.*, 2003);

Thermosediminibacter oceani JW/IW-1228P^T, 46.3 ± 0.7 mol% (n = 4; Lee *et al.*, 2005);

Thermosediminibacter litoriperuensis JW/YJL-1230-7/2^T, 45.2 ± 0.7 mol% (n = 6; Lee *et al.*, 2005);

Tindallia californiensis APO^T, 40.2 ± 0.1 mol% (n = 3; Pikuta *et al.*, 2003a).
